A Comparison of fei and aber
Stefan HINTERWIMMER — University of Cologne
Cornelia EBERT — Leibniz-Zentrum Allgemeine Sprachwissenschaft

Abstract. This paper compares the modal particle fei (Schlieben-Lange 1979, Thoma 2009) with the modal particle/sentence adverb aber (not to be confused with the conjunction aber, ‘but’). Intuitively, both items express some form of contrast and correction. We will show that both are special among discourse particles in the following sense: They not only make a contribution that is interpreted at a level distinct from the level where at issue content (Potts 2005) is interpreted – as is standard for modal particles (see Gutzmann 2015 and the references therein). Rather, they also exclusively relate to propositions that have not entered the Common Ground via being the at-issue content of an assertion made by the addressee.

Keywords: discourse particles, assertions, at-issue-content, presuppositions, conventional implicatures, conversational implicatures

1. Introduction

In this paper we compare the Bavarian modal particle fei (Schlieben-Lange 1979, Thoma 2009), which does not have a direct counterpart in standard German, with the modal particle/sentence adverb aber (not to be confused with the conjunction aber, ‘but’), which exists in Bavarian as well as in standard German. Intuitively, both items express some form of contrast and correction. We will show that both are special among discourse particles in the following sense, however: They not only make a contribution that is interpreted at a level distinct from the level where at issue content (Potts 2005) is interpreted – as is standard for modal particles (see Gutzmann 2015 and the references therein). Rather, they also exclusively relate to propositions that have not entered the Common Ground via being the at-issue content of an assertion made by the addressee.

Following Hinterwimmer (to appear), we assume that fei is used by the speaker to direct the addressee’s attention to a conflict between her own and the addressee’s beliefs that is not maximally prominent at the point where the sentence containing fei is uttered. Such a conflict would be maximally prominent if a proposition $p$ entailing the negation of the proposition $q$ denoted by the sentence with fei had been previously asserted by the addressee. After all, by asserting $p$ the addressee has presented herself as believing $p$ to be true and proposed to add $p$ to the Common Ground (Stalnaker 1978). It is thus evident to a speaker who believes a proposition $q$ entailing the negation of $p$ that the addressee believes not $q$, and by asserting $q$ it likewise becomes evident to the addressee that the speaker believes not $p$. Consequently, the conflict between the addressee’s and her own beliefs can be assumed by the speaker to be

---

We would like to thank the audiences at SuB 22 and at the workshop Transmodal Perspectives on Secondary Meaning at the Twelfth International Tbilisi Symposium on Language, Logic and Computation (TbILLC) for questions and comments. The work of the second author is supported by a DFG grant for the project PSIMS within the Priority Programme XPRAG.de.
obvious not only to her, but to her addressee as well as soon as she has asserted \( q \), and there is hardly any need to draw the addressee’s attention to it.

The situation is different whenever the speaker only infers on the basis of contextual information and/or general background knowledge that the addressee believes a proposition \( p \) entailing the negation of the proposition \( q \) he is about to assert, or when \( \text{not } q \) is entailed by a conventional or conversational implicature or a presupposition of a previous utterance by the speaker. In such a case, the addressee has not explicitly proposed to add \( p \) to the Common Ground, and the question of whether \( p \) is true is therefore not automatically maximally prominent at the point where the speaker is about to assert the proposition \( q \). Consequently, the conflict in beliefs does not automatically become maximally prominent as soon as the speaker has asserted \( q \). The addition of \( \text{fei} \) to a sentence denoting \( q \) in order to direct the addressee’s attention to that conflict is thus not superfluous.

This explains the distribution of \( \text{fei} \), which is as follows: First, \( \text{fei} \) cannot be added felicitously to a sentence denoting a proposition \( q \) in a situation where the addressee has previously asserted a proposition \( p \) which contradicts \( q \). Second, the addition of \( \text{fei} \) is perfectly felicitous when the speaker’s assumption that the addressee believes \( p \) is based on contextual information and/or general background knowledge, or when \( p \) is a conventional or conversational implicature or a presupposition of a previous utterance by the speaker.

The discourse particle/sentence adverb \( \text{aber} \), in contrast, requires there to be a proposition \( p \) entailing the negation of the proposition \( q \) denoted by the sentence with \( \text{aber} \) that is, on the one hand, prominent at the point where that sentence is uttered. On the other hand, \( p \) may likewise not be the at-issue content of a sentence previously uttered by the addressee. Consequently, \( \text{aber} \) behaves like \( \text{fei} \) in certain respects and can felicitously be added to a sentence denoting the proposition \( q \) whenever the speaker can infer on the basis of contextually salient information that the addressee believes a proposition \( p \) entailing \( \text{not } q \). In contrast to \( \text{fei} \), however, \( \text{aber} \) cannot be added to a sentence denoting the proposition \( q \) in the three following situations: (a) The information on the basis of which the speaker infers that the addressee believes \( p \) is not contextually salient, but only general background knowledge. (b) \( p \) is entailed by a conventional implicature of a previous utterance of the addressee. (c) \( p \) is entailed by a presupposition of a previous utterance of the addressee.

The paper is structured as follows. Section 2 introduces the data to be accounted for. Section 3 summarizes the analysis of \( \text{fei} \) proposed in Hinterwimmer (to appear). Our analysis of \( \text{aber} \) is presented in section 4. Section 5 gives the conclusion.

2. Data

Consider the contrast between the felicity of \( \text{fei} \) and \( \text{aber} \) in Tom’s reaction in (1), on the one hand, and their infelicity in Tom’s reaction in (2), on the other. Since \( \text{aber} \), as already said in the introduction, exists in standard German as well as in Bavarian, where it is spelled out as \( \text{oba} \), all examples are given in Bavarian for ease of comparison. The modal particle \( \text{doch} \), which likewise exists in standard as well as in Bavarian German, has been included for comparison.

(1) Paula (wearing only a shirt): I geh spaziern.

\( \text{I'll go for a walk.} \)
Tom: S’is (fei/oba/doch) saukoit draussn.
  It’s terribly cold outside.

(2) Paula: S’is goa ned koit drauss’n.
  It’s not cold at all outside.
Tom: (So a Schmarr’n!) S’is (#fei/#oba/doch) saukoit drauss’n.
  (What nonsense!) It’s terribly cold outside.

In (1), the proposition denoted by the sentence Tom utters contradicts a proposition which Tom can plausibly assume Paula to believe on the basis of her non-verbal behavior in combination with the sentence she utters – namely that it is not cold outside. If she believed otherwise, she would presumably not leave the house with the intention to go for a walk wearing only a shirt. In such a situation, not only doch, but also fei and oba can be added felicitously. In (2), in contrast, Paula has explicitly asserted that it is not cold outside. In that situation, only doch, but neither fei nor oba can be added felicitously. It thus seems to make a difference whether the addressee has previously asserted a proposition that contradicts the proposition denoted by the sentence with fei or oba, or whether it can only be inferred by the speaker that the addressee believes that proposition on the basis of a combination of verbal and non-verbal behavior. The modal particle doch, in contrast, seems to be insensitive to that difference.

Consider next the contrast between (3) and (4). In (3), the addition of fei or oba is presumably infelicitous for the same reason for which it was infelicitous in (2) – the addressee has previously asserted a proposition which contradicts the proposition denoted by the sentence containing the respective discourse particle/sentence adverb (these sentences will henceforth be called the prejacent). In (4), in contrast, where the same proposition – namely that Otto has eaten the whole cake – has not been asserted, but rather conversationally implicated by the addressee’s immediately preceding utterance, both fei and oba can be added felicitously.

(3) Paula: Da Otto hod den ganzn Kuacha gessn.
  Otto has eaten the whole cake.
  Otto hasn’t eaten the cake. It was Maria!

(4) Paula: Da Otto is in da Kich gwen und da Kuacha is weg.
  Otto was in the kitchen and the cake is gone.
Tom: Da Otto hod den Kuacha fei/oba/doch ned gessn. Das woa d’Maria.
  Otto hasn’t eaten the cake. It was Maria!

Taken together, the contrasts discussed so far could be taken to show that both fei and oba can only be added to a sentence denoting the proposition $p$ if the speaker believes, but does not know for sure that the addressee believes a proposition contradicting $p$. After all, it is one of the defining features of conversational implicatures that they can be cancelled, and inferences based on verbal combined with non-verbal behavior are usually defeasible as well. As soon as an interlocutor $x$ has asserted a proposition $q$, in contrast, the other interlocutors know for sure that $x$ at least presents herself as believing $q$, and in the absence of mind-reading abilities that is the strongest evidence that one can hope to get that $x$ believes $q$. But now consider the following contrasts.
(4) Paula: In Fronkreich gibts imma no an Kini.
   In France there is still a king.
   Tom: (So a Schmarr’n.) In Fronkreich gibts (#fei/#oba/doch) koan Kini nemma.
   What nonsense! In France there is no king anymore.

(5) Paula: Da Kini von Fronkreich is a Depp.
   The king of France is an idiot.
   Tom: In Fronkreich gibts (fei/?oba/doch) koan Kini nemma.
   In France, there exists no king of France anymore.

The infelicity of both fei and oba in Tom’s reaction to Paula’s statement in (4) is exactly what we would expect, given what we have said so far, since the proposition asserted by Tom contradicts the proposition asserted by Paula. What is unexpected, though, is the felicity of fei in Tom’s reaction to Paula’s statement in (5): It is standardly assumed, following Strawson (1950) (see Elbourne 2013 for an overview over the discussion), that by using the definite article the speaker presupposes the existence of a unique entity satisfying the predicate denoted by the respective NP. Consequently, Paula (wrongly) assumes the Common Ground to entail the existence of a unique king of France at the point at which she utters the sentence. Tom has therefore just as strong evidence that Paula believes there to be a king of France in the case of (5) as he has in the case of (4). Concerning fei, it is thus not tenable that its addition is infelicitous whenever the speaker knows that the addressee believes a proposition contradicting the proposition denoted by the prejacent. The addition of oba, in contrast, while not being quite as infelicitous as in (4), is at least awkward in (5) as well.

Let us turn to the contrast between (6) and (7) next.

(6) Paula: Da Chomsky is a berühmta Soziologe.
   Chomsky is a famous sociologist.
   Tom: (So a Schmarr’n). Da Chomsky is (#fei/#oba/doch) koa Soziologe.
   What nonsense! Chomsky is fei no sociologist.

(7) Paula: Da Chomsky, a berühmta Soziologe, is a Anarchist.
   Chomsky, a famous sociologist, is an anarchist.
   Tom: Da Chomsky is (fei/?oba/doch) koa Soziologe.
   Chomsky is no sociologist.

Again, the infelicity of fei and oba in Tom’s reaction to Paula’s utterance in (6) is unsurprising in light of the discussion so far. What is remarkable, however, is that fei is fully felicitous in Tom’s reaction to Paula’s utterance in (7). After all, as far as the relation between the proposition denoted by Tom’s reaction and the proposition that Chomsky is a famous sociologist is concerned, the only difference between (6) and (7) is the following: In (6) that proposition is the at-issue content of Paula’s previous assertion, while in (7) it is a conventional implicature in the sense of Potts (2005). As shown by Potts (2005), nominal appositives such as a berühmte Soziologe (‘a famous sociologist’) in (7), appositive relative clauses, and expressives belong to a special kind of linguistic content dubbed conventional implicatures. One of the defining features of conventional implicatures is that they, in contrast to ‘ordinary’ semantic content, and similar to presupposed content, are not affected by semantic operations
such as negating and questioning: The sentences in (8a-b), for example, are not understood as negating or questioning that Jennifer is a great drummer, but only that she will join the band.

(8) a. Jennifer, who is a great drummer, will not join the band.
   b. Will Jennifer, who is a great drummer, join the band?

At the same time, and in contrast to presupposed content, conventionally implicated content is assumed by the speaker to be new to the addressee. Intuitively, the contrast between conventionally implicated and ‘ordinary’ asserted content, which Potts (2005) dubs at-issue content, is the following: Getting across the at-issue content is the main point of the respective utterance. It is thus explicitly put on the table by the speaker (see Farkas & Bruce 2010), and the addressee is invited to at least implicitly accept the respective proposition, or otherwise reject it explicitly. Conventional implicatures, in contrast, constitute side remarks that do not really promote the conversation and are assumed to be uncontroversial by the speaker, i.e. the speaker expects the addressee to simply accept them. This intuition is formalized by Potts (2005) in the following way: At-issue and conventionally implicated content are assumed to be interpreted at separate levels that do not interact with each other. By uttering the opening sentence in (7), Paula thus makes two claims at the same time: That Noam Chomsky is an anarchist, and that Noam Chomsky is a famous sociologist. The two claims do not have the same status, though. While the first one is the main point of her utterance, and she invites Paul to at least implicitly accept or else reject it, the second one is just a side remark she assumes to be uncontroversial. Nevertheless, Tom does not have any more reason to doubt that Paula believes Chomsky to be a famous sociologist in (7) than in (6), where that proposition is the at-issue content of her assertion. The felicity of fei in Tom’s reaction in (7) thus provides further evidence that it is not the question of whether the speaker knows or only believes that the addressee believes a proposition contradicting the prejacent of fei that is at stake. The behavior of oba, in contrast, is less clear in this regard: While its addition to Tom’s reaction in (7) is certainly not as infelicitous as in (6), it is still awkward and clearly considerably less felicitous than the reaction with fei.

Interestingly, the reaction in (7) with oba becomes entirely acceptable once Paula’s utterance is addressed and acknowledged first.

(9) Paula: Da Chomsky, a berühmte Soziologe, is a Anarchist.
    Chomsky, a famous sociologist, is an anarchist.
Tom: Aha / Wenn’s moanst... / Ja scho...
    Ok / If you think so... / Yes, ok,...
    Da Chomsky is oba koa Soziologe.
    Chomsky is oba no sociologist.

We assume that by his reaction Tom acknowledges Paula’s utterance and thus agrees to the respective content being added to the Common Ground. After Tom’s acknowledgement, all parts of Paula’s utterance have entered the Common Ground and are now equally prominent. And this seems to be the crucial difference that sets (9) apart from (7). We observe the same pragmatic effect in (5), where Tom’s reaction can also be rescued by acknowledging the content of Paula’s utterance first.
Paula: Da Kini von Fronkreich is a Depp. 
*The king of France is an idiot.*

Tom: Aha / Wenn’st moanst... / Ja scho... 
*Ok / If you think so... / Yes, ok,...*

In Fronkreich gbfts oba koan Kini nemma. 
*In France, there exists oba no king of France anymore.*

Note also that, unsurprisingly, the facts in (7) and (9) can be re-established with speech-accompanying gestures, which have been claimed to pattern exactly like appositives by Ebert & Ebert (2014).

Paula: Des TRIANGLE [Stoppschild] in der Müllerstroß is nei.²
*The stop sign in Müllerstraße is new.*

Tom: Des is/Stoppschilder san (fei/#oba/#doch) ned dreieckad. 
*It is/stop signs are not triangular.*

Again, adding an acknowledging phrase in Tom’s response to Paula’s remark makes *oba* felicitous.

Tom: Des neie Buach vom Kehlmann is (fei/#oba/#doch) spitze! 
*The new book by Kehlmann is great!*

Intuitively, for *fei* to be felicitous it is sufficient for Tom to have good reasons to believe on the basis of general background knowledge that his addressee would have expected the new book by Daniel Kehlmann to be not great (because she does not like the books by Daniel Kehlmann, for example, or believes that no great books are written anymore these days). Consequently, the addition of *fei* would be awkward if Tom knew his addressee to be a fan of Daniel Kehlmann, for example, or to have no opinion whatsoever regarding the books of Daniel Kehlmann. Concerning *oba*, in contrast, general background knowledge is not sufficient to license its use (and similarly for *doch*): Even in a context where the addressee is well known to hate the books by Daniel Kehlmann, the addition of *oba* to (13) leads to infelicity if the sentence is uttered out of the blue. Rather, for *oba* to be felicitous, the question of whether the new book by Daniel Kehlmann is great needs to have been raised at least implicitly in the preceding conversation. Additionally, just as with *fei*, the speaker needs to have good reasons

---

² We indicate that a gesture GEST occurs at the same time as a certain expression EXP by GESTURE_[EXP]. TRIANGLE denotes a gesture where the speaker iconically indicates a triangular object.
to believe that the addressee would have expected the new book by Daniel Kehlmann to be not great. Consequently, both fei and oba are perfectly fine in Tom’s reaction to Paula’s utterance in (14).

(14) Paula: S’gibt oifach koane gscheidn Biacha nemma.
   *There simply are no good books anymore.*
   Tom: Des neie Buach vom Kehlmann is (fei/oba/doch) spitze!
   *The new book by Kehlmann is great!*

With this in mind, consider next the contrast between (15) and (16).

(15) Paula: Des neie Buach vom Kehlmann is spitze!
   *The new book by Kehlmann is great.*
   Tom: Des is (#fei/#oba/doch) da letzte Schmarr’n.
   *It’s complete nonsense.*

(16) Paula: I find des neie Buach vom Kehlmann spitze!
   *I find the new book by Kehlmann great.*
   Tom: Des is (#fei/oba/doch) da letzte Schmarr’n.
   *It’s complete nonsense.*

Again, the infelicity of both fei and oba in Tom’s reaction to Paula’s utterance in (15) is expected in light of our discussion so far, since the at-issue content of Paula’s utterance contradicts the at-issue content of Tom’s utterance. The infelicity of fei in Tom’s reaction to Paula’s utterance is likewise expected, since the at-issue content of that utterance entails that she believes a proposition that contradicts the prejacent of fei – namely that the new book by Daniel Kehlmann is nonsense. What is surprising, however, is the felicity of oba in (16), which, given what we have said so far, should be infelicitous for the same reason as fei. In contrast to fei, oba only seems to be infelicitous when the addressee has previously asserted a proposition \( p \) that contradicts the prejacent, but not when she has asserted that she ‘finds’ \( p \). When a speaker says that she finds \( p \), this is a subjective judgment presented as an opinion and not a fact (for an analysis of German finden ‘find’, see among others Reis 2013, Umbach in press), which seems to matter for the felicity of Tom’s reaction with oba in (16).

Consider furthermore the following exchange between Paula and Tom.

(17) Paula: I woaß ned ob I ma des neie Buach üba d’Münchna Räterepublik kafa sui.
   *I don’t know if I should buy the new book about the Soviet republic of Munich.*
   Tom: Des is (fei/oba/doch) interessant.
   *It’s interesting.*

In the case of (17), Paula’s utterance indicates that she believes neither the proposition denoted by Tom’s reaction nor its negation, i.e. she considers it both possible that the book is interesting and that it is not interesting – otherwise there would be no point in making the utterance in the first place. In such a situation, the addition of fei is perfectly felicitous, while oba is degraded (although far from being infelicitous).

Our observations regarding the distribution of fei and oba can be summarized as follows.
(a) The distribution of *fei*:

*fei* can be added felicitously to a sentence denoting the proposition *p* in a context where the interlocutor either believes *not* *p* or at least considers *not* *p* to be a likely option and *not* *p*

(i) can be inferred from the context or general background assumptions, or

(ii) is entailed by the conversational or conventional implicatures or presuppositions of a previous utterance by the interlocutor.

The addition of *fei* is infelicitous, in contrast, if there is a previous utterance by the interlocutor whose at-issue content in combination with the fact that the interlocutor has asserted it entails that she believes *not* *p*.

(b) The distribution of *oba*:

*oba* can be added felicitously to a sentence denoting *p* in a context where

(i) a proposition entailing *not* *p* is activated in the discourse,

(ii) it can be inferred that the addressee believes *not* *p*,

(iii) there is no recent assertion *A* by the addressee such that the at-issue content of *A* entails *not* *p* and

(iv) neither the presuppositions nor the conventional implicatures of a recent utterance by the interlocutor entail *not* *p*.

Having presented data that illustrates the differing felicity conditions of *fei* and *aber*, we will show in the following that the two particles sometimes also differ in their perlocutionary force.

(18)  (Tom just sat down on a chair next to Melanie.)
Melanie to Tom: Do sitzt (fei/oba/doch) imma d’Miriam.
*This is where Miriam usually sits.*

All particles are licensed in (18). There is, however, a difference in what (18) pragmatically conveys depending on the particle used. While the utterance with *doch* is an allegation and indicates that Melanie is of the opinion that Tom should know about the fact that Miriam usually sits in this chair, with *fei* it has informational character and conveys that Melanie assumes that Tom does not know about this fact, fully in line with what we have argued so far about the semantics of *fei*. With *oba*, however, (18) turns into a demand for Tom to stand up and look for a different place to sit. In other words, while (18) with *fei* is an informational statement, with *oba* it is a demand.

Similarly, in the following example, adding *oba* turns the utterance into an implicit demand, while *fei* and *doch* do not.

(19)  Child:  Wos gibt’s zum Mittogessen?
*What have you cooked for lunch?*
Mother:  Lachs mit Spinat.
*Salmon with spinach.*
Child:  I mog (fei/oba/doch) koan Spinat ned!
I don’t like spinache!

With *oba*, the child implicitly asks his mother to prepare some alternative food for him, the utterance with *fei* or *doch* lack this connotation.

In section 3, we will summarize and partially refine the analysis of *fei* argued for in Hinterwimmer (to appear), and in section 4 we will present our analysis of *oba* and discuss how this analysis can account for the observed semantic behaviour of *oba* and its pragmatic effects.

3. The analysis of *fei*

*fei* is a modal particle that is derived from Latin *finis* and French *fin* (*end, border*) and has entered Bavarian German in the 12th century (Schlieben-Lange 1979, Glaser 1999). As already said in the introduction, *fei* does not have a direct counterpart in standard German. Distributionally, it shares all the characteristics of modal particles (Weydt 1969; Thurmair 1989; Jacobs 1991; Omelius-Sandblom 1996; Zeevat 2003; Karagjosova 2004; Corniglio 2011; Zimmermann 2008; 2011, Gutzmann 2015; see the papers in Bayer and Struckmeier 2017 for a recent overview): It is always optional, it can only occur in the so-called middle field, it cannot receive the main accent of the respective clause, it cannot be questioned, it cannot be negated and it does not contribute to the truth conditions of a sentence containing it, i.e. a sentence with *fei* always has the same truth conditions as the corresponding sentence without *fei* (see Thoma 2009 and Hinterwimmer to appear for details). In descriptive linguistic work, *fei* is taken to add emphasis to the meaning of the sentence containing it. The first analysis of *fei* in modern linguistic terms has been proposed by Thoma (2009), and that analysis is also the starting point for the analysis proposed by Hinterwimmer (to appear).

Thoma (2009) assumes that *fei* is not only a modal particle, but also encodes polarity focus. The second assumption is refuted in Hinterwimmer (to appear). For reasons of space, we cannot go into the details of that refutation here, and have to refer the interested reader to Hinterwimmer (to appear). According to Thoma (2009), the felicity conditions of *fei* can be stated as follows: Adding *fei* to a sentence $\alpha$ with propositional content $p$ is felicitous in a context $C$ iff the speaker believes in $C$ that the addressee believes $\neg p$. Based on the data discussed in section 2, Hinterwimmer (to appear) shows that Thoma’s analysis, while capturing an essential component of *fei*’s felicity conditions, misses an important aspect – namely that *fei* is only felicitous if the speaker’s assumption that the addressee believes $\neg p$ is inferred on the basis of contextually available information or general background knowledge, or if the conversational or conventional implicatures of a previous utterance by the addressee in combination with the fact that she has made that utterance entail that she believes $\neg p$. Whenever the at-issue content of a previous utterance by the addressee in combination with the fact that she has made that utterance entail that she believes $\neg p$, in contrast, the addition of *fei* is infelicitous. Additionally, as shown by the felicity of *fei* in Tom’s reaction to Paula’s utterance in (17), repeated here as (20), the felicity conditions assumed by Thoma (2009) are too strong: The speaker need not believe that the addressee believes $\neg p$. Rather, it is sufficient that she believes the addressee to consider $\neg p$ a likely option.

(20) Paula: I woaß ned ob I ma des neie Buach üba d’Münchna Räterepublik kafa sui.
I don’t know if I should buy the new book about the Soviet republic of Munich.
Tom: Des is (fei/oba/doch) interessant.
It’s interesting.

In order to state the felicity conditions just sketched precisely, it is crucial to have a clear definition of at-issue content as opposed to secondary, i.e. presupposed or conventionally implicated content. Hinterwimmer (to appear) follows AnderBois et al. (2015) and Murray (2017) in assuming that at-issue content differs from conventionally implicated content in the way in which it enters the Common Ground: It is only the at-issue content that is asserted, where for a proposition to be asserted means that the speaker explicitly proposes to add it to the Common Ground. Crucially, the respective proposition is only added to the Common Ground after the addressee has explicitly or implicitly accepted it. From this it follows that it is entirely unproblematic for the addressee to directly deny or question an asserted proposition. For conventional implicatures, in contrast, there is no intermediate step, i.e. they enter the Common Ground directly. Consequently, the addressee cannot directly deny or question a conventional implicature, but rather has to employ special means that interrupt the flow of the conversation such as saying “Hey, wait a minute!” (Shannon 1976; von Fintel 2004) first. The same applies to presupposed content, which, even if it is not already part of the Common Ground, is at least treated by the speaker as if it was. Finally, since it is one of the defining features of conversational implicatures that they can be cancelled, it is clear that they are likewise not asserted.

With these assumption in place, the felicity conditions of fei can now be stated informally as given in (22). Note that the version in (22) differs from the one in Hinterwimmer (to appear) in the following respect: It is stated in such a way that it accounts for the infelicity of fei in cases where the addressee has asserted a proposition entailing ¬p as well as for the infelicity of fei in cases such as (16), repeated here as (21), which were not discussed in Hinterwimmer (to appear). In (21), the speaker has not asserted a proposition entailing ¬p, but rather a proposition entailing that she ‘finds’ ¬p. Condition (ii) is general enough to account for both cases: If the addressee has asserted a proposition entailing ¬p, then the fact that she has uttered that proposition entails that she believes ¬p, and if she has asserted a proposition entailing that she ‘finds’ ¬p, then the fact that she has uttered that proposition entails that she believes that proposition as well.

(21) Paula: I find des neie Buach vom Kehlmann spitze!
    I find the new book by Kehlmann great.
Tom: Des is (#fei/oba/doch) da letzte Schmarr’n.
     It’s complete nonsense.

(22) fei can be added felicitously to a sentence α denoting the proposition p in context C iff
    (i) the speaker believes that the addressee considers ¬p a likely option.
    (ii) there is no recent assertion A by the addressee such that the content of A in combination with the fact that the addressee has asserted it entails that the addressee believes ¬p.

This informal analysis (or rather, a close variant of it) is formally implemented in Hinterwimmer (to appear) in a possible worlds framework along the lines of Hintikka (1969).
On such an analysis, a person $x$ believes a proposition $p$ in a world $w$ iff $p$ is true in all worlds $w'$ that are compatible with what $x$ believes in $w$. In order to formalize the notion of considering a proposition a likely option, existential instead of universal quantification is required. Unrestricted existential quantification over the addressee’s belief worlds would be too weak, however, to formalize the first felicity condition in (22): This would predict $fei$ to be felicitous whenever the speaker assumes that the addressee does not completely exclude the possibility that $\neg p$ is true. Rather, what we need is existential quantification not over the entire set of the addressee’s belief worlds, but rather over the following subset: The set of worlds containing only those worlds that correspond to the addressee’s assumptions about what is stereotypically the case (cf. Kratzer’s 1981 analysis of modal verbs).

Putting everything together, the informally stated felicity conditions can be formalized as in (23), which is paraphrased in (24).

(23) $fei$ can be added felicitously to a sentence $\alpha$ denoting the proposition $p$ in context $C$ iff

(i) $\forall w \in DOX_{SP,w^*} [\exists w^* \in MAX_{Stereo-ADR}(DOX_{ADR,w})[\neg p(w^*)]]$,

where $SP$ is the speaker in $C$, $ADR$ is the addressee in $C$, $w^*$ is the world of $C$, $DOX_{SP,w^*}$ is the set of worlds compatible with what $SP$ believes in $w^*$, and $MAX_{Stereo-ADR}$ is the function mapping a set of worlds to the subset that makes as many of $ADR$’s assumptions about what is stereotypically the case true as possible.

(ii) $\neg \exists e [Assertion(e)(w^*) \land Agent(e, ADR) \land recent(\tau(e)) \land Content(e) = q \land \forall w \forall e \forall x [Assertion(e)(w) \land Agent(e, x) \land sincere(e, x) \land Content(e) = q \to \forall w \in DOX_{x,w} [\neg p(w)]]$.

(24) $fei$ can be added felicitously to a sentence $\alpha$ denoting the proposition $p$ in context $C$ iff

(i) all of the speaker’s belief worlds contain at least one world that is compatible with as many of the addressee’s assumptions about what is stereotypically the case as possible where the negation of $p$ is true,

(ii) there is no recent assertion of a proposition $q$ by the addressee such that in all worlds where an individual $x$ sincerely asserts $q$, $\neg p$ is true in all worlds that are compatible with what $x$ believes in $w$ (i.e. there is no recent assertion of a proposition by the addressee such that whenever someone asserts that proposition sincerely, she believes $\neg p$).

These felicity conditions account for all the facts discussed in section 2. Concerning the question of why there should be a modal particle with such complex and subtle felicity conditions, the reasoning already sketched in the introduction applies: $fei$ can be used by the speaker to direct the addressee’s attention to a conflict between her own beliefs and the addressee’s beliefs that is not maximally prominent at the point where the sentence with $fei$ is uttered. That is the case when the speaker’s assumption that the addressee at least considers a proposition contradicting the propositional content of the prejacent of $fei$ to be a likely option is inferred on the basis of contextual information or general background knowledge. It is also the case if the presuppositions or conversational or conventional implicatures of a recent
utterance by the addressee entail such a proposition. Whenever the addressee has asserted a proposition such that it automatically follows from her having asserted it sincerely that she believes a proposition contradicting the propositional content $p$ of the prejacent of $fei$, in contrast, simply asserting $p$ would have been sufficient to make the conflict between the speaker’s and the addressee’s beliefs maximally prominent.

4. The analysis of $oba$

After having presented our analysis of $fei$, let us now return to $oba$, the Bavarian version of aber (‘but’) (recall that the only reason why we discuss the Bavarian instead of the standard German version is to facilitate comparison with $fei$ – as far as we know, there are no relevant semantic or pragmatic differences between the two uses). As already said in the introduction, we are only interested in its uses as a speech act particle or sentence adverb in this paper, i.e. in those uses where it does not conjoin two clauses, but rather occurs after the finite verb in a sentence that is uttered as a reaction to a previous utterance of an interlocutor. Recall from section 2 that $oba$ just as $fei$, (a) can be used if the speaker assumes the addressee to believe a proposition $p$ that contradicts the proposition denoted by the prejacent and (b) cannot be used if the addressee has asserted a proposition that entails $\neg p$, but differs from $fei$ in the following respects: First, it is at least awkward when a proposition entailing $\neg p$ is presupposed or conventionally implicated by a previous utterance of the addressee (see (5) and (7), repeated here as (25) and (26), respectively, cf. also (11)). Second, it is not sufficient that the speaker believes on the basis of general background knowledge that the addressee believes $\neg p$. Rather, that the addressee believes $\neg p$ has to be inferable on the basis of contextually salient information $p$ (see (13) and (14), repeated here as (27) and (28), respectively). Finally, $oba$ is felicitous when the addressee has previously asserted a proposition entailing that she ‘finds’ $\neg p$ (see (15) and (16), repeated here as (29) and (30), respectively).

(25) Paula: Da Kini von Fronkreich is a Depp.  
   *The king of France is an idiot.*
   Tom: In Fronkreich gibts ($fei$/??$oba$/doch) koan Kini nemma.

(26) Paula: Da Chomsky, a berühmte Soziologe, is a Anarchist.  
   *Chomsky, a famous sociologist, is an anarchist.*
   Tom: Da Chomsky is ($fei$/??$oba$/doch) koa Soziologe.  
   *Chomsky is no sociologist.*

(27) Tom: Des neie Buach vom Kehlmann is ($fei$/#$oba$/#doch) spitze!  
   *The new book by Kehlmann is great!*

(28) Paula: S’gibt oifach koane gscheidn Biacha nemma.  
   *There simply are no good books anymore.*
   Tom: Des neie Buach vom Kehlmann is ($fei$/oba/doch) spitze!  
   *The new book by Kehlmann is great!*

(29) Paula: Des neie Buach vom Kehlmann is spitze!  
   *The new book by Kehlmann is great.*
   Tom: Des is (#$fei$/#$oba$/doch) da letzte Schmarr’n.
It’s complete nonsense.

(30) Paula: I find des neie Buach vom Kehlmann spitze!
I find the new book by Kehlmann great.
Tom: Des is (#fei/oba/doch) da letzte Schmarr’n.
It’s complete nonsense.

While there are various analyses of the English equivalent of aber/oba, but (see, e.g., Lakoff 1971, Winter and Rimon 1994, and Umbach 2005), the use of aber/oba as a sentence adverb of speech act particle has received rather little attention (but see Kwon 2005 and the references therein). As we will now show, the felicity conditions of aber/oba just repeated can be captured in a way that is in large parts very similar to our analysis of fei, but also differs from it in certain relevant aspects.

(31) aber can be added felicitously to a sentence α denoting the proposition p in context C iff
(i) a proposition q entailing ¬p is salient and q is one of the possible answers to the current question under discussion (QU), with p entailing another possible answer.
(ii) there is no recent assertion A by the addressee such that the at-issue content of A entails ¬p.

The condition in (31ii) is closely related to the second felicity condition of fei stated formally in (23ii) and informally in (22ii), with one crucial difference: According to (22ii)/(23ii), what is disallowed is the existence of a recent assertion such that the propositional content of the assertion in combination with the fact that the addressee has made that assertion entails that she believes ¬p. That formulation captures the observation that fei is infelicitous not only in cases such as (29), where the addressee has asserted a proposition entailing ¬p — in that case, that the new book by Daniel Kehlmann is not nonsense —, but also in cases such as (30), where she has asserted a proposition entailing that she ‘finds’ ¬p. The condition in (31ii), in contrast, is formulated in such a way that it allows cases of the latter kind, and only disallows cases of the former kind.

The condition in (31i) differs more fundamentally from the one in (22i)/(23i). It captures both the infelicity of oba/aber in cases such as (27) and its felicity in case such as (28), and the observation that oba, in contrast to fei, is infelicitous if the presuppositions or conventional implicatures of a previous assertion by the addressee entail ¬p. The crucial point is the requirement that both, the prejacent p, and the contextually salient proposition q entailing ¬p, constitute possible answers to the current question under discussion (QU). This notion goes back to Roberts (1996; see Klein and von Stutterheim 1987 and van Kuppevelt 1995 for similar

Note that Umbach (in press) argues that subjective judgments [such as the complements of finden ‘find’] present their propositions as mere opinions, not intended to enter the common ground’ (Umbach in press, p. 28 of final draft). As they are not intended to enter the common ground, they do not open up new issues for discussion, i.e. they do not affect the table. This would mean that, according to Umbach, they do not raise any QUDs, which in turn would mean that oba should not be licensed in a reaction to subjective statements as in (30), contrary to what we find. Our analysis is, however, in line with Reis (2013), who proposes that finden ‘find’ triggers the presupposition that there is an open issue that is under debate. In other words, there is a QUD that is presupposed by using the word vinden ‘find’. We assume that it is this QUD that is addressed by the reaction with oba in (30).
views) and is based on the following idea: Not only utterances in oral conversations answer explicit or implicit questions, but also sentences in all kinds of written texts. In cases where the QUD is implicit, the task of the addressee/reader is to identify the QUD that the respective sentence answers on the basis of its focus-background structure, where the explicitly given or inferable parts correspond to the background and the new parts to the focus: The focal part replaces the wh-term contained in the implicit QUD, thus picking one from the set of possible answers. The given or inferable material, the background, in contrast, corresponds to the remaining part of that subquestion.

Now, the assumption that the contextually salient proposition contradicting the prejacent of *oba* has to be a possible answer to the current QUD automatically rules out cases where the propositional content of the prejacent of *oba* contradicts the presupposition of a previous utterance of the addressee, as in (25): Being presupposed and thus at least being treated as if it was already part of the Common Ground by the one who utters the respective sentence, a presupposed proposition can by definition not answer the QUD (which, in the case of (25) can only be a question such as *What is the king of France like?*, but not a question such as *Is there a king in France?*). Concerning conventional implicatures, Simons et al. (see also Beaver et al. 2017) show, based on contrasts like the one between (32) and (33), that they, in contrast to the at-issue content of a sentence, can never answer the current QUD:

(32) Tom: Where did Mary buy her new dress?
    Susan: Mary, who lives in Potsdam, bought it at a store in Berlin.
    Susan: #Mary, who bought it at a store in Berlin, lives in Potsdam.

(33) Tom: Where does Mary live?
    Susan: Mary, who bought her new dress at a store in Berlin, lives in Potsdam.
    Susan: #Mary, who lives in Potsdam, bought her new dress at a store in Berlin.

The felicity conditions stated informally in (31) above and stated more formally in (34) thus successfully capture the distribution of *oba*.

(34) *aber* can be added felicitously to a sentence α denoting the proposition p in context C iff
    (i) ∃q[∀w[q(w) → ¬ p(w)] ∧ prominent(q, time(C))] ∧ q ∈ QED_{time(C)} ∧ ∃r ∈ QUD_{time(C)}
    ∀w[p(w) → r(w)]],
    where QUD_{time(C)} is the question under discussion at the time of C.
    (ii) ¬∃e[Assertion(e)(w*) ∧ Agent(e, ADR) ∧ recent(τ(e)) ∧ Content(e) = q ∧ ∀w[q(w)
    → ¬ p(w)]].

It would be worth pursuing the relation between the conjunction uses of *oba/aber* and its uses as a discourse particle. Interestingly, Umbach (2005) proposes an analysis of the conjunction *but* which is also based on the notion of QUD. Very roughly, and simplifying considerably, she assumes that *but* is felicitous iff each of the two clauses conjoined by *but* answers one of two polar questions serving as the subquestions of an (usually implicit) superquestion, with one of the two questions being answered positively and the other negatively. Further investigating the relation between our analysis of *oba/aber* as a sentence adverb or discourse
particle and Umbach’s (2005) analysis of the conjunction but is a topic that we have to leave for future research.

We will now turn to the perlocutionary acts of utterances with aber/oba and fei, i.e. examples (18) and (19), repeated here as (35) and (36).

(35) (Tom just sat down on a chair next to Melanie.)
Melanie to Tom: Do sitzt (fei/oba/doch) imma d’Miriam.
This is where Miriam usually sits.

(36) Child: Wos gibts zum Mittogessen?
What have you cooked for lunch?
Mother: Lachs mit Spinat.
Salmon with spinage.
Child: I mog (fei/oba/doch) koan Spinat ned!
I don’t like spinache!

The pragmatic effect of the oba-reaction in (35) directly follows from our analysis that oba is licensed only if the corresponding utterance addresses a current QUD. In case of (35), there is no explicit preceding discourse and thus no obvious QUD. By sitting down on the chair next to Melanie, there is, however, an implicit question that is raised, namely whether this seat is taken or not and whether Tom is allowed to sit there or not. It is this question that is addressed by Melanie’s reaction and answered negatively. This is why the reaction in (35) with oba is understood as an implicit demand to change seats. With fei, on the other hand, there is no implicit QUD that needs to be addressed. The fact that Tom sat down on Miriam’s place simply indicates that he apparently believes this seat is not taken (in general and not taken by Miriam in particular), which licenses the utterance with fei.

As for (36), the reasoning is parallel. As the semantics of oba requires that there is a QUD that is addressed by the corresponding utterance, the child’s reaction with oba triggers a presupposition that there is such a QUD. In case of (36) it would most sensibly by a question such as Can I eat this? as a follow-up to What have you cooked for lunch?. The child’s reaction with oba would then be interpreted as answering the question whether what the mother prepared for lunch is something that he can eat, indicating that the answer is no. Hence, the reaction receives the character of a demand to the mother to prepare something different for the child. Again, with fei, there is no such connotation, because an utterance with fei does not have to address a current QUD.

5. Conclusion and outlook

In this paper we have compared the felicity conditions of the Bavarian discourse particle fei and the sentence adverb or modal particle oba/aber.

One question we have not addressed and which is still an open question is why oba/aber is licensed and used very frequently in reactions to demands or requests.

(37) Mother: Du sollst deine Hausaufgaben machen.
You have to do your homework.
Child: Ich mach aber keine Hausaufgaben!
I won’t do my homework!

It is not clear whether imperatives can be taken to induce QUDs and, if so, which ones. One could speculate that they trigger the QUD whether the addressee does what is demanded or not (see Gutzmann 2012, p. 99). If that is the case, this would explain why the reaction in (37) is fully acceptable – it addresses the QUD whether the child will obey and answers it negatively.

We leave a comprehensive analysis of aber in reactions to imperatives for future research.
